

How to test eyes

Many people always ask how to tell if their eyes are bad. This will go over what needs to be done to test that out.

Thing you'll need. You will need your gun with a good battery and a cell phone that has a camera on it.

First check and make sure there is no paint or anything blocking the eyes, if so they need to be cleaned before continuing. Now check and make sure none of the wire for your eyes are pinched and that they have not been pulled out from there white Molex connector. Pinched wires are a number one cause of eye issues.

After making sure your wires are still in good condition, take your phone and go to your camera mode. With your gun on and nothing in the breach look down the feedneck of the gun using your camera. Your eyes should give off a white/purple static light that is visible via your phone screen, only one side will light up depends which side your "clear" or transmitting eye is on. If you see the light this means your eyes are good and should be working, if no light is visible then that most likely means the eyes are bad and needs to be replaced.
